Description

Hello,

Foreman version: 1.13.4

I need to deploy virtual machine in a cluster vmware. In this cluster, I can deploy a virtual machine on a cluster datastore or a simple datastore storage.

But on Forman, when I choose a cluster datastore and submit I get this failure:

Failed to create a compute CBV (VMware) instance micah-keedy.jmsp.prod: InvalidArgument: A specified parameter was not correct: Datastore outside the pod is specified for a disk to be placed inside the pod

I think host parameters should only contain either "cluster datastore" or "datastore" values, not both. But in this case, I can't disable a simple datastore.

Regards

This got potentially fixed by #4509 and related changes, please try 1.16+ and report back.
