we encountered the following kind of errors when trying to create VM on ovirt 4.1 via Foreman:
Failed to create a compute xxx (oVirt) instance xxx: Cannot remove VM: The following disks are locked: xxx_Disk2, xxx_Disk1.
Please try again in a few minutes. | | OVIRT::OvirtException: Cannot remove VM: The following disks are locked: xxx_Disk2, xxx_Disk1. Please try again in a few minutes
The error only occurred on slow storage devices as volumes backend.
Looking through app/models/compute_resources/foreman/model/ovirt.rb model I saw that it is destroying the vm if either interfaces or volumes creation fails.
I also identified the following piece of code for volume creation:

def create_volumes(vm, attrs)
  #add volumes
  volumes = nested_attributes_for :volumes, attrs
  volumes.map do |vol|
    set_preallocated_attributes!(vol, vol[:preallocate])
    #The blocking true is a work-around for ovirt bug fixed in ovirt version 3.1.
    vm.add_volume({:bootable => 'false', :quota => ovirt_quota, :blocking => api_version.to_f < 3.1}.merge(vol)) if vol[:id].blank?
  end
  vm.volumes.reload
end

Changing 3.1 with 5.1 (actually enforcing blocking behavior) solved the issue.
So it seems that for ovirt 4.1 and slow storage devices the code must wait until the volume is added.
