**Description**

If we try to install custom certs on satellite with wildcard i.e CN=*.example.com katello-certs-check gives the wrong output.

katello-certs-check gives the command to generate the capsule certs as below instead of satellite-installer command.

```bash
To use them inside a NEW $FOREMAN_PROXY, run this command:

capsule-certs-generate --foreman-proxy-fqdn "$FOREMAN_PROXY"
    --certs-tar "~/FOREMAN_PROXY-cert.tar"
    --server-cert "~/customcerts/cert_crt.pem"
    --server-key "~/customcerts/cert_key.pem"
    --server-ca-cert "~/customcerts/CA_crt.pem"

capsule-certs-generate --foreman-proxy-fqdn "$FOREMAN_PROXY"
    --certs-tar "~/FOREMAN_PROXY-cert.tar"
    --server-cert "~/customcerts/cert_crt.pem"
    --server-key "~/customcerts/cert_key.pem"
    --server-ca-cert "~/customcerts/CA_crt.pem"
    --certs-update-server
```

**Revision 86979bce - 07/18/2019 02:59 PM - Suraj Patil**

Fixes #25564 - add target option

Rather than attempting to detect the target based on the hostname, this adds an explicit parameter which allows users to force the output to match their use.

Co-Authored-By: Ewoud Kohl van Wijngaarden <ewoud@kohlvanwijngaarden.nl>
