A capsule details tab shows 'TFTP server: false' when the tftp_servername is not configured in the proxy settings. This causes confusion as it seems like the tftp is not configured properly, while it is actually configured.

### How reproducible:
100%

### Steps to Reproduce:
1. Installer satellite with tftp enabled
2. Go to internal capsule details, service tab
3. See TFTP server: false

### Actual results:
`TFTP server false`

### Expected results:
Since we fallback to the proxy url as the next server, we should probably show this info in the ‘TFTP server name’ as well
