**Pull request:** https://github.com/theforeman/foreman/pull/6827

**Fixed in Releases:** 1.22.1, 1.23.0

**Found in Releases:**

**Description**

We send the data to correlate logs but instead request we send session id. This is confusing, I am going to actually send both.

**Edit:** Also, second part of the problem is that we send session id, which could be vulnerable to session hijacking. We must only send `logging_token` which is a randomly generated token stored in the session. -- this is actually not true, session mdc field is not vulnerable.
