Description
It is possible in some cases plugins create a duplicate component registry or try to register a component that has already been registered. We should be more defensive about these situations.

Fixes #28821 - Make component registry resilient to duplication
Some plugins might create a new registry or try to register a component that is already registered. This moved the actual registry to the window object and makes the ComponentRegistry class an interface for it. It also allows registering the same component multiple times without erroring.
